## **DETAILED ACTION**

### ***Allowable Subject Matter***

1. Claims 1-7, 9, 10 and 16-20 allowed
2. Claim 15 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

### ***Claim Rejections - 35 USC § 103***

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 11-14 rejected under 35 U.S.C. 103(a) as being unpatentable over Arase (JP 04069939) in view of Schuele et al. (5,717,250)

Regarding Claims 11-14, Arase discloses field effect transistor of insulating gate type where in Figl. 1, an N+ type diffusion region 13 is disclose in the P-type substrate 11 with P+ type polysilicon plug 17a is located on top of the N+ type diffusion region and a wiring layer 18 is located on top of the P+ type polysilicon plug 17a. Futhermore, N+ type diffusion region 13 extends on the surface of the P-type substrate 11 and P+ type polysilicon plug extends from the surface of the substrate. Region 17a and 13 form a PN junction. Wiring layer 18 a is directly on top of the polysilicon plug 17a. Arase fails to disclose the first and second insulating layers and their required relationships with silicon plug. Schuele et al. disclose a sputter and CVD deposited titanium nitride barrier layer

Art Unit: 2826

between a platinum layer and a polysilicon plug where in Fig. 6, insulating layer 63 formed on an upper surface of the polysilicon plugs both labeled as 16

It would have been obvious to one of having ordinary skill in the art at the time the invention was made to include the required first and second insulating films with their required relationship to polysilicon plug in Arase as taught by Schuele et al. in order to have a semiconductor device with better insulation characteristics.
